**CALCULATED NOMINAL DENSITIES FOR ACTIVE
WROUGHT ALUMINUM AND WROUGHT ALUMINUM ALLOYS**

Density is dependent upon composition and nominal density is determined by computation rather than by a weight method. The values shown below have been computed in accordance with the Aluminum and Aluminum Alloy Density Calculation Procedure appearing on pages 2-13 and 2-14 of Aluminum Standards and Data.²⁰ These calculated densities are nominal values and should not be specified as engineering requirements but may be used in calculating nominal values for weight per unit length, weight per unit area, covering area, etc.

Limiting the expression of nominal density to the number of decimal places indicated is based on the fact that composition variations are discernible from one cast to another for most alloys. The expression of nominal density to more decimal places than allowed by the following implies higher precision than is justified and should not be used.

1. Alloys listed below which have a minimum aluminum content of 99.35% or greater have nominal density values which are rounded in the US customary system (lbs/in³) to the nearest multiple of 0.0005 and in the metric system [(kg/m³) x 10³] to the nearest multiple of 0.005.
2. Alloys listed below which have a minimum aluminum content of less than 99.35% have nominal density values which are rounded in the US customary system (lbs/in³) to the nearest multiple of 0.001 and in the metric system [(kg/m³) x 10³] to the nearest multiple of 0.01.

The US customary (lbs/in³) unit values are derived from metric values and subsequently rounded and are not to be back-converted to metric values.

Designation	Density	
	lbs/in. ³	(kg/m ³) x 10 ³
